Congratulations on your new TermaTech wood-burning stove. In order to enjoy your new wood-burning stove as much as possible it is important that you read this user’s manual thoroughly, even if you have previously owned a wood-burning stove. Please also read the Supplementary installation instructions for the UK market (Last 6 pages). Before you can really enjoy your wood-burning you have to become familiar with it. Already after firing the first few times you will begin to be familiar with your new wood-burning stove. In the following sections we will go through the use.

TermaTech wood-burning stoves are tested and approved according to the EN 13240 (CE) norm as well as Sintef approval in Norway, i.e. according to some of Europe’s strictest demands for wood-burning stoves. Naturally the stoves are also in accordance with the requirements in the Danish ‘Order concerning wood-burning stoves’ which came into effect on 1.6.2008. The approvals give you a guarantee that your wood-burning stove is approved according to the most important Scandinavian and European standards which means that the stove complies with a number of requirements for among other things safety, environment and efficiency which leads to good firing economy.
1. BEFORE INSTALLING THE WOOD-BURNING STOVE

When installing your wood-burning stove you must make sure that all local laws, incl. those that refer to national and European standards, are followed. It is always a good idea to consult your chimney sweep before installation. It must be emphasised that the Hetas controller or Building control always has to approve the installation, even if a wood-burning stove was installed previously. You also have to make sure that the placement complies with the current rules in the Building Regulations for small houses. See the below statement of minimum distances to flammable materials. If the wood-burning stove is to be installed near a non inflammable there are no requirements for minimum distance, but we recommend 8-10 cm behind the stove for cleaning purposes.

2. DISTANCE TO FLAMMABLE MATERIAL

All distances have been determined in connection with approval of the wood-burning stove.

100 mm behind the stove to flammable material.
200 mm beside the stove to flammable material.
900 mm in front of the stove to flammable material.

100 mm behind
200 mm to the side
900 mm in front

The floor underneath the wood-burning stove must be non inflammable or coated with a non inflammable material. The non inflammable material, e.g. a steel plate, glass plate, slate/ imitation slate or tile, must be placed so it reaches at least 300 mm in front of the wood-burning stove and at least 150 mm to each side of the opening of the wood-burning stove.

Caution: TT40W – wall mounted
You should always ask your stove dealer to mount the TT40W on the wall. Together with the TT40W there is a wall hanging plate, where the stove shall be mounted on. The wall hanging plate must be carefully and secure fastened to the wall, before the stove can be mounted. It is very important to use screws and / or other materials, which are working together with the materials of the wall. The stove has a weight of approx.100 kg. Ask your Hetas installer or your stove dealer, if you have further questions about security and local rules.
3. THE CHIMNEY

The chimney is the lung of the wood-burning stove, i.e. a chimney with good draught is a precondition for good combustion. You must use a chimney with a diameter of at least Ø150 mm which is the equivalent of an internal diameter of 175 cm² for your TermaTech stove. It is important to follow the directions in the Building regulations for small houses and to make sure that the existing or new chimney is high enough to ensure optimum draught in the wood-burning stove. The chimney must be of sufficient height so the draught conditions are okay and the smoke does not bother anyone. We recommend 80 cm above the ridge. If the chimney does not have sufficient draught smoke nuisances and poor combustion can occur. If the chimney draught is not sufficient an evacuator can be mounted on the chimney. If there is too much draught, a damper can be mounted on the chimney. Ask your dealer or your local chimney sweep if you have doubts.

4. VENTILATION

Combustion air is a precondition for a good and clean combustion. In most cases there is sufficient air in the room. However in special cases it may be necessary to provide extra air in the room where the stove is placed. This can e.g. be done by mounting an air valve in the exterior wall of the room. Air valves which add necessary combustion air must be kept clean.

5. BEFORE USE OF THE OVEN

It is very important that you make sure that the heat cover above the firewood compartment is mounted in the stove; it is loose from the manufacturer and could fall down during transport. Place the heat cover right below the door/bottom of the combustion chamber so it protects the firewood compartment against radiant heat. The heat cover is mounted by letting the 4 pegs rest on convection holes inside the firewood compartment.

6. BEFORE THE FIRST LIGHTING

The first time the stove is lit must be done gently as all the materials need to get use to the heat. The Senotherm varnish that the stove is painted with will harden the first couple of times the stove is heated, and it may cause some odour nuisances. So make sure that you have proper ventilation.

Do not touch the painted surface, when the stove is hot. The painting has to harden up first.

7. LIGHTING AND FIRING IN THE WOOD-BURNING STOVE

It is very important to heat your wood-burning stove and chimney as fast as possible in order to create optimum draught in the chimney and achieve the best combustion. A wood-burning stove made from sheet iron will give during lighting/cooling, this may result in creaks, that is completely normal for the stove and should not be considered as a complaint.

1. When you light your wood-burning stove we recommend the use of kindling, i.e. thin wooden sticks (app. 1.2 – 1.5 kg), in the bottom of the stove, laid in a criss-
cross pattern as a log house. Put 2 firelighters in the middle and light them (never use alcohol, petrol, other flammable liquids or magazines for lighting).

2. Open air damper for lighting air (the damper at the bottom of the wood-burning stove), this is done by pushing the rod under the door all the way to the right.

3. Leave the door ajar so there is an opening of about 2-3 cm. Leave the stove like that for about 8-10 minutes before you close the door completely.

4. The air damper at the top of the oven, above the door, is opened completely by pushing it to the right.

5. Let the kindling burn to a solid layer of embers (there are no more flames) before firewood is put into the wood-burning stove.

6. Put 2 pieces of firewood in the stove, app. 1.5 – 1.8 kg total. The pieces are both put at the bottom of the stove and parallel to the front of the stove, with equal distance to the stove's sides and with mutual distance of about 1 cm. The front piece is best lit if it has a split side that is turned to the door and one in the embers. Close the door completely immediately.

7. When there are good, visible flames in the fire (after about 2-4 minutes) the damper for lighting air is closed (the damper at the bottom of the wood-burning stove).

8. The air damper at the top of the stove can be regulated down a little bit to 2/3 open, and after another few minutes it can be closed to 1/ open. How much or how little the damper should be regulated depends among other things on the chimney draught and the firewood. The flames must stabilise to a calmly burning fire.

9. When the wood has burned to embers (after about 1hour) you start again from point 6.

In order to get the optimum combustion it is important that you only regulate the effect or heat amount with the firing. Small pieces of firewood give a more powerful combustion than large pieces of firewood as the surface is bigger and thereby more gas is released. The amount of firewood in the combustion chamber is also crucial, for normal use you should not put more than 2 logs (max. 2 kg per hour) into the stove and that is how you get the optimum effect. If you want a higher heat amount you should put logs in the stove with many 'open' sides, they burn more powerfully and faster, but also give out larger amounts of heat.

**NOTE! Remember that the handles on the wood-burning stove get hot, so use a glove when you use the stove.**

**NOTE! Never light with the lighting damper open. (only for start-up)!**

### 8. FIRING

Your TermaTech wood-burning stove is made for firing with wood/firewood, we recommend the use of split hardwood that has been stored for at least one year outdoors under a roof. Preferably put the firewood on a wooden pallet, bearers or the like so it is off the ground. Remember to bring in the firewood in good time before use so surface moisture can evaporate.

**Kindling** is the designation for finely split wood/sticks that are about 20-30 cm long and have a diameter of 2-3 cm preferably with many open surfaces.

**Firewood** should have a diameter of 7-9 cm and be no more than about 30 cm long, otherwise it will get too close to the side of the stove. The most important thing for good combustion is that the wood is dry (15-18% moisture). If the firewood is too wet it is difficult to get it to burn, the chimney draught is nonexistent, there is a lot of smoke and the exploitation is lower and it damages the environment. Furthermore there may be damage to the stove and the chimney in the shape of shining soot and tarry deposits. If the firewood is too dry it will burn too quickly, and often the gasses in the wood are released faster than they can burn.
and some go unburned through the chimney. This also gives lower exploitation and harms the environment.

**Bio-briquettes** can be used, but they develop a lot of ash and dust.

**Coal & Energy coke** must not be used as it contains a lot of sulphur which wears on a stove, the chimney and the environment. The life of stove and chimney will be significantly reduced by using this firing type and the right to claim compensation for the product is void.

9. **MAINTENANCE – ALWAYS USE ORIGINAL PARTS**

Maintenance and cleaning of the stove should only be performed when the stove is cold. The daily maintenance is limited, but once a year the stove should get thorough maintenance. The combustion chamber should be cleaned for ashes and soot and the door hinges and the closing mechanism should be lubricated with copper grease and tightened if necessary.

**The surface** is maintained by brushing it with a soft, long-haired brush or a dust brush. Always remember: only when the stove is cold.

**Jointings** can look okay, but they collapse under the heat and thereby lose the ability to keep the stove sealed. Jointings should be changed as needed as it is important to good combustion and a clean window that the stove is sealed.

**Insulation** in the combustion chamber that are broken or worn can easily be changed as they are loosely fixed. The material used is called Vermiculite and is a porous, but very suitable insulation material. It has no effect on the stove’s efficiency that the insulation cracks. However, it should be changed when the wear surpasses half of the original thickness or when corners break off.

**Painting** the stove with Senotherm-spray can cover spots or small scratches. Larger damages needs to be ground with fine steel wool, vacuumed and then sprayed. The can has to be shaken vigorously and then sprayed on at a distance of 15-20 cm (remember to cover glass and handles). It is very important that the stove is not in use and completely cold before you use the spray due to the fire hazard. In order to keep the stove’s varnished surfaces looking nice for years to come you should try to avoid touching the varnished surfaces when the stove is hot.

**Glass** normally does not need any maintenance apart from cleaning. This is most easily done by using TermaTech’s glass cleaner. Glass is made of ceramic glass, be sure of environmentally disposal.

**Original parts** which need to be changed due to wear can be found at your dealer. Because of fit etc. only original parts from termaTech should be used.

**Right to claim compensation for defective product** is under current law. When stating deviations the use of the product must be suspended immediately and the dealer must be contacted. The right to claim compensation implies correct use of the wood-burning stove. Spare parts and wearing parts like Vermiculite, glass, jointings and handles are not covered by the guarantee as they are worn with use. These parts can be changed and bought as spare parts from your dealer.

**Chimney/Flues:** Swept and cleaned to manufacturers recommendations.
10. MALFUNCTIONS

If problems should occur with the use of the stove the cause can possibly be found below. If not, then you are always welcome to contact your dealer.

**The stove is difficult to control – it burns too fast:** If the stove is new, then check that the directions have been followed. If the stove is more than 1 year old or if it has been used heavily, then the jointings may need to be changed. If the jointings sit for too long the heat makes them lose their ability to keep the stove sealed. Check your firewood, if it is too dry it may burn too fast/powerfully.

If there is heavy draught in the chimney it may be necessary to fit a damper in it.

**The stove has poor draught after installation:** Check that the mounting instructions have been followed. It is especially the conditions surrounding the chimney that may cause problems. Are diameter and length okay, is it sealed, are smoke pipe and junctions sealed? Is the cleaning hatch sealed? You may need to contact a chimney sweep to remedy the problem as the chimney may be blocked.

**Smoke and soot smell:** This can be caused by down-draught in the chimney and most often happens in specific wind directions. The chimney may be too short for the ridge or surrounding trees.

Remember not to open the door while there are flames.

**The stove is difficult to light and may die out:** There may be a number of causes. The most typical are that the firewood is too wet, the damper is not sufficiently open, the draught in the chimney is too small or maybe it is blocked or leaking. The ember layer was too small/incinerated and did not give enough heat to light the logs (see point 7.5). Possibly give some start-up air to the fire by opening the damper. Then the damper has to be closed again. Depending on the problem it may be necessary to contact the dealer or a chimney sweep.

**The glass soots up:** The wood is too moist, Lack of draught in the chimney or wrong firing.

11. QUESTIONS AND ANSWERS

If you have further questions concerning your TermaTech wood-burning stove – see [www.termatech.com](http://www.termatech.com)

12. GOOD ADVICE FOR THE WOOD-BURNING STOVE

If the stove has not been used for a long time the chimney should be checked for possible blockage before lighting. Furthermore it is a good idea to remove any dust from the wood-burning stove as it might smell after a long break.

If a regulation or smoke damper has been fixed to the chimney it should not close of more than 80% of the internal diameter of the chimney.
The ashes can be put in the rubbish bin for garbage collection. The ashes should always have cooled for 1-2 days before it is put in the rubbish bin, as there might still be embers that can light garbage or a garbage bag.

**The Danish Environmental Protection Agency has made a list of advice to how to fire correctly in your wood-burning stove:**

- It is important to fire correctly and with the correct firing in your wood-burning stove. Always make sure that there is plenty of air and never fire with printed paper, plastic, household waste or wood that may be painted, varnished, glued or impregnated.
- When you are lighting it is important that the fire takes hold and that the temperature rises quickly. E.g. light with dry brushwood or kindling wood.
- Only fire with clean and dry wood in your wood-burning stove.
- When you hit two pieces of dry wood against each other it makes a 'crisp' or 'dry' sound. It is a good idea to bring in the firewood in good time so the surface moisture evaporates before it goes into the wood-burning stove.
- Do not put too much firewood into the wood-burning stove at once. With small amounts it is easier for the fire to take hold and reach a high temperature quickly. Put more firewood into the wood-burning stove a little at a time and remember to turn up the air each time until there is a nice fire again.
- Air is important to ensure good combustion. As long as there are yellow flames you do not need to turn up the air supply. A good combustion of the exhaust gasses requires a high temperature and sufficient air. If you turn it down too quickly the unburned gasses will rise up through the chimney and leave soot. It is a bad idea to let the wood-burning stove burn all night with a minimum of air. The chimney may soot up and poor combustion leads to more unhealthy smoke.
- If you are unsure whether your wood-burning stove bothers anyone, then go outside and see if there is a lot of smoke. If you think it smells badly, then your neighbour probably thinks so too.

**Average values for testing**

- Exhaust gas temperature: 324º C
- Exhaust gas mass flow: 4.4 g/s
- Efficiency: 79.6%
- Nominal Heat output: 5 kW
- Flue draught: 0.12 mbar/12 Pa
SUPPLEMENTARY INSTALLATION INSTRUCTIONS FOR THE UK MARKET
TO BE READ IN CONJUNCTION WITH THOSE IN THE INSTRUCTION BOOKLET

READ THE INSTRUCTION BOOKLET AND THESE SUPPLEMENTARY INSTRUCTIONS CAREFULLY BEFORE INSTALLATION

These instructions together with those in the instruction booklet cover the basic principles to ensure the satisfactory installation of the stove, although detail may need slight modification to suit particular local site conditions.
In all cases the installation must comply with current Building Regulations, Local Authority Byelaws and other specifications or regulations as they affect the installation of the stove. It should be noted that the Building Regulations requirements may be met by adopting the relevant recommendations given in British Standards BS 8303, BS EN 15287-1:2007 as an alternative means to achieve an equivalent level of performance to that obtained following the guidance given in Approved Document J.

Please note that it is a legal requirement under England and Wales Building Regulations that the installation of the stove is either carried out under Local Authority Building Control approval or is installed by a Competent Person registered with a Government approved Competent Persons Scheme. HETAS Ltd operate such a Scheme and a listing of their Registered Competent Persons can be found on their website at www.hetas.co.uk.

CO Alarms:-

Building regulations require that when ever a new or replacement fixed solid fuel or wood/bio-mass appliance is installed in a dwelling a carbon monoxide alarm must be fitted in the same room as the appliance. Further guidance on the installation of the carbon monoxide alarm is available in BS EN 50292:2002 and from the alarm manufacturer’s instructions. Provision of an alarm must not be considered a substitute for either installing the appliance correctly or ensuring regular servicing and maintenance of the appliance and chimney system.

HEALTH AND SAFETY PRECAUTIONS

Special care must be taken when installing the stove such that the requirements of the Health and Safety at Work Act are met.

Handling
Adequate facilities must be available for loading, unloading and site handling.

Fire Cement
Some types of fire cement are caustic and should not be allowed to come into contact with the skin. In case of contact wash immediately with plenty of water.
Asbestos
This stove contains no asbestos. If there is a possibility of disturbing any asbestos in the course of installation then please seek specialist guidance and use appropriate protective equipment.

Metal Parts
When installing or servicing this stove care should be taken to avoid the possibility of personal injury.

STOVE PERFORMANCE
Please refer to the table in the main instruction manual for details of the stoves’ performances

PREPARATORY WORK AND SAFETY CHECKS

IMPORTANT WARNING
This stove must not be installed into a chimney that serves any other heating appliance.

There must not be an extractor fan fitted in the same room as the stove as this can cause the stove to emit fumes into the room.

Chimney
In order for the stove to perform satisfactorily the chimney height must be sufficient to ensure an adequate draught of approximately 15 Pa so as to clear the products of combustion and prevent smoke problems into the room.

NOTE: A chimney height of not less than 4.5 metres measured vertically from the outlet of the stove to the top of the chimney should be satisfactory. Alternatively the calculation procedure given in EN 13384-1 may be used as the basis for deciding whether a particular chimney design will provide sufficient draught.

The outlet from the chimney should be above the roof of the building in accordance with the provisions of Building Regulations Approved Document J.

If installation is into an existing chimney then it must be sound and have no cracks or other faults which might allow fumes into the house. Older properties, especially, may have chimney faults or the cross section may be too large i.e. more than 230 mm x 230 mm. Remedial action should be taken, if required, seeking expert advice, if necessary. If it is found necessary to line the chimney then a flue liner suitable for solid fuel must be used in accordance with Building Regulations Approved Document J.

Any existing chimney must be clear of obstruction and have been swept clean immediately before installation of the stove. If the stove is fitted in place of an open fire then the chimney should be swept one month after installation to clear any soot falls which may have occurred due to the difference in combustion between the stove and the open fire.

If there is no existing chimney then any new system must be to the designation described above and in accordance with Building Regulations Approved Document J.
A single wall metal fluepipe is suitable for connecting the stove to the chimney but is not suitable for use as the complete chimney. The chimney and connecting fluepipe must have a minimum diameter of 150 mm and its dimension should be not less than the size of the outlet socket of the stove.

Any bend in the chimney or connecting fluepipe should not exceed 45°. 90° bends should not be used.

Combustible material should not be located where the heat dissipating through the walls of fireplaces or flues could ignite it. Therefore when installing the stove in the presence of combustible materials due account must be taken of the guidance on the separation of combustible material given in Building Regulations Approved Document J and also in these stove instructions.

If it is found that there is excessive draught in the chimney then a draught stabiliser should be fitted. Fitting of a draught stabiliser will affect the requirement for the permanent air supply into the room in which the stove is fitted in accordance with Approved Document J (see also combustion air supply).

Adequate provision e.g. easily accessible soot door or doors must be provided for sweeping the chimney and connecting fluepipe where it is not intended for the chimney to be swept through the appliance.

**Hearth**

The hearth should be able to accommodate the weight of the stove and its chimney if the chimney is not independently supported. The weight of the stove is indicated in the brochure.

The stove should preferably be installed on a non-combustible hearth of a size and construction that is in accordance with the provisions of the current Building Regulations Approved Document J.

The clearance distances to combustible material beneath, surrounding or upon the hearth and walls adjacent to the hearth should comply with the guidance on the separation of combustible material given in Building Regulations Approved Document J and also in these stove instructions.

If the stove is to be installed on a combustible floor surface, it must be covered with a non-combustible material at least 12mm thick, in accordance with Building Regulations Approved Document J, to a distance of 30 cm in front of the stove and 15 cm to each side measuring from the door of the combustion chamber.

**Combustion air supply**

In order for the stove to perform efficiently and safely there must be an adequate air supply into the room in which the stove is installed to provide combustion air. The provision of air supply to the stove must be in accordance with current Building Regulations Approved Document J. An opening window is not appropriate for this purpose.

**Connection to chimney**

Stoves may have a choice of either a rear or top flue gas connector that allows connection to either a masonry chimney or a prefabricated factory made insulated metal chimney in accordance with their instructions. In some cases it may be necessary to fit an adaptor to increase the diameter of the flue to the minimum required 150 mm section of the chimney or liner.
**Commissioning and handover**
Ensure all parts are fitted in accordance with the instructions.

On completion of the installation allow a suitable period of time for any fire cement and mortar to dry out, before lighting the stove. Once the stove is under fire check all seals for soundness and check that the flue is functioning correctly and that all products of combustion are vented safely to atmosphere via the chimney terminal.

On completion of the installation and commissioning ensure that the operating instructions for the stove are left with the customer. Ensure to advise the customer on the correct use of the appliance and warn them to use only the recommended fuel for the stove.

Advise the user what to do should smoke or fumes be emitted from the stove. The customer should be warned to use a fireguard to BS 8423:2002 (Replaces BS 6539) in the presence of children, aged and/or infirm persons.

---

**WARNING NOTE**

Properly installed, operated and maintained this stove will not emit fumes into the dwelling. Occasional fumes from de-ashing and re-fuelling may occur. However, persistent fume emission is potentially dangerous and must not be tolerated. If fume emission does persist, then the following immediate action should be taken:

(a) Open doors and windows to ventilate the room and then leave the premises.
(b) Let the fire go out.
(c) Check for flue or chimney blockage and clean if required.
(d) Do not attempt to relight the fire until the cause of the fume emission has been identified and corrected. If necessary seek expert advice.

The most common cause of fume emission is flueway or chimney blockage. For your own safety these must be kept clean at all times.

**IMPORTANT NOTES**

**General**
Before lighting the stove check with the installer that the installation work and commissioning checks described above have been carried out correctly and that the chimney has been swept clean, is sound and free from any obstructions. As part of the stoves’ commissioning and handover the installer should have shown you how to operate the stove correctly.

**CO Alarm**
Your installer should have fitted a CO alarm in the same room as the appliance. If the alarm sounds unexpectedly, follow the instructions given under “Warning Note” above.
Use of fireguard

When using the stove in situations where children, aged and/or infirm persons are present a fireguard must be used to prevent accidental contact with the stove. The fireguard should be manufactured in accordance with BS 8423:2002 (Replaces BS 6539).

Chimney cleaning

The chimney should be swept at least twice a year. It is important that the flue connection and chimney are swept prior to lighting up after a prolonged shutdown period.

If the stove is fitted in place of an open fire then the chimney will require sweeping after a month of continuous operation. This is a precaution to ensure that any “softer” deposits left from the open fire usage have not been loosened by the higher flue temperatures generated by the closed stove.

In situations where it is not possible to sweep through the stove the installer will have provided alternative means, such as a soot door. After sweeping the chimney the stove flue outlet and the flue pipe connecting the stove to the chimney must be cleaned with a flue brush.

Periods of Prolonged Non-Use

If the stove is to be left unused for a prolonged period of time then it should be given a thorough clean to remove ash and unburned fuel residues. To enable a good flow of air through the appliance to reduce condensation and subsequent damage, leave the air controls fully open.

Extractor fan

There must not be an extractor fan fitted in the same room as the stove as this can cause the stove to emit smoke and fumes into the room.

Aerosol sprays

Do not use an aerosol spray on or near the stove when it is alight.

Use of operating tools

Always use the operating tools provided when handling parts likely to be hot when the stove is in use.

Chimney Fires

If the chimney is thoroughly and regularly swept, chimney fires should not occur. However, if a chimney fire does occur turn off the stove immediately and isolate the mains electricity supply (if applicable), and tightly close the doors of the stove. This should cause the chimney fire to go out. If the chimney fire does not go out when the above action is taken then the fire brigade should be called immediately. Do not relight the stove until the chimney and flueways have been cleaned and examined by a professional.

Permanent air vent

The stove requires a permanent and adequate air supply in order for it to operate safely and efficiently.

In accordance with current Building Regulations the installer may have fitted a permanent air supply vent into the room in which the stove is installed to provide combustion air. This air vent should not under any circumstances be shut off or sealed.
USER OPERATING INSTRUCTIONS

Please read the important notices given above before referring to the main instruction book for detailed operating instructions.

Recommended fuels
Stoves may be designed to burn dry seasoned wood logs and/or solid mineral fuel as indicated in the main stove manuals.

HETAS Ltd Approval
HETAS approval may be limited to specific fuel types as detailed in the main instruction manuals. Approval does not cover the use of other fuels either alone or mixed with the recommended fuel, nor does it cover instructions for the use of other fuels.
